TE WAI TIKANGA

**Tukituki
Land Care**

**Mangaonuku
Catchment**

**Summary report
to July 2026**

DISCLAIMER

Data - The following report is intended to provide a summary of the data received from Tukituki Land Care's, Mangaonuku catchment sampling programme and does not replace the official IANZ accredited reports in any way shape or form. In some cases, data points will be omitted to allow trending to be displayed more clearly. Please refer to the official lab reports as the primary source of information or for official reporting.

Test Information - Please note this is generalised information only about the tests and not to be used for any other purpose. Much of this information has been taken from the New Zealand Drinking Water Standards as New Zealand does not have Standards for streams, lakes, or rivers. Please treat all information with caution.

TEST INFORMATION

Escherichia Coli (E. coli) - Unlike other bacteria that comprise the total coliform group of organisms, *E. coli* is generally not found growing and reproducing in the environment. Consequently, *E. coli* is considered to be a species within the Coliform group that is the best indicator of recent faecal pollution and the potential for the presence of more dangerous disease-causing organisms (or pathogens).

HBRC planned target <260 E.coli/100ml

Nitrate and Nitrite Nitrogen (NO₃ + NO₂ - N) – The recommended limit in New Zealand is 11.4 mg/L for drinking water. If these limits are exceeded, excessive fertiliser use, human and/or animal waste contamination should be suspected.

*Five-year median for all sites in New Zealand is 0.027 mg/L**

Ammonia (NH₄) Nitrate (NO₃) and Nitrite (NO₂) Nitrogen – The recommended limit in New Zealand is 11.4 mg/L for drinking water. If these limits are exceeded, excessive fertiliser use, human and/or animal waste contamination should be suspected. High Nitrogen levels in water sources can cause excess algae growth and can lower the dissolved oxygen content of the waterway creating a toxic environment for aquatic life.

*Five-year median for all sites in New Zealand is 0.29 mg/L**

Dissolved Reactive Phosphorous – this is a proportion of Total Phosphorus that can readily and immediately support plant growth. High levels of dissolved reactive phosphorous can cause an increased risk of algal bloom.

HBRC planned target <0.010 mg/L

HBRC Rolling Medium for Mangaonuku Stream 0.018 mg/L
